I will create a website where users can make transcription requests.They can see the progress of their requests. The manager of the transcription department can assign each request to a transcriptor . Transcription is the process of transforming the school books or images which are contained to these books into an accessible format. They can define certain criteria for each transcription ,like font size, font name, colour of the text ,background colour, level of contrast and quality of the image. Each user/student will sign in and then he can see the requests that he made and/or create new ones.

There are three roles:

a) user/student,who submits the requests.

b) manager of transcription department, who delegates/assigns the requests to the corresponding transcriptors.

c) transcriptors , who see the transcriptions that they have to complete. They will submit the progress of the transcriptions. The users and the managers will be able to see the progress for each transcription request.

As far as I know , there are no websites handling similar needs. However the general idea of making orders after losing in to an account is used by sites which handle air or bus ticket booking, like the following:

https://www.flibco.com/en#/booking

https://www.ryanair.com/ie/en/

https://www.swiss.com/lu/en/book/Flight/sid6d3m

I will use forms for login and carousel to display the images that have been uploaded by the users. I will use breadcrumbs and other components for creating a transcription request.
